

## STARTING TREE FOR LL and LR

## Case 1: Left-Left Imbalance (Single Rotation)

Then, there is an insertion somewhere in T1 that causes A's height to increase by 1. Now, height(left) and height(right) differ by 0.

```
for rotateLeftChild(C, parent(B))
    A = A.left
    C.left = A.right
    A.right = C
    if C == root of tree = A
        if parent(B).left = C
            parent(B).left = A
            parent(B).right = A
        updateHeight(C)
        updateHeight(A)
```

We can adjust for this imbalance with a SINGLE ROTATION by rotating the node of imbalance with its left child. After the rotation, A has the same height as C did in the original tree.

## Case 2: Left-Right Imbalance (Double Rotation)

An insertion in T2 causes C to become the node of imbalance.

Notice that a single rotation wouldn't fix things.

B represents the rest of T2. Inserting into T2 cannot be fixed by a single rotation (left or right). T2L and T2R are shown as half way to the next level (balance only). Notice the insertion happened would rotate down to the next level.

Observations:

- All values in T2L fall between A and B.
- In T2L, could be the left child of B or the right child of A.
- All values in T2R fall between B and C.
- In T2R, could be the right child of B or the left child of C.

T2R:

- Step 1: Rotate A with its right child (B). (same rotation as LR imbalance)
- Step 2: Rotate C with its left child (now B is B after step 1).

Step 1: Rotate A with Right Child B.

```
for rotateRightChild(C, parent(B))
    C = C.right
    B.right = C.left
    C.left = B
    rotateLeftChild(C, parent(B))
```

Step 2: Rotate C with Right Child B.

After this rotation, either T2L or T2R will be as deep as T1 and T3, but not both.

## STARTING TREE FOR RR and RL

## Case 4: Right-Right Imbalance (Single Rotation)

Insertion into T3 causes it to be 2 levels deeper than T1, making A the node of imbalance.

Remember: All values in T3 fall between A and C. So T3 could be connected to the left of C or the right of A.

## Case 3: Right-Left Imbalance (Double Rotation)

As with Case 2, an insertion into T3 cannot be solved with a single rotation. So, we need to explicitly consider the rest of T3, labeled as B here.
